The DNA was hydrodynamically sheared by repeated passage through 80.05 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /sex="Male"

High-efficiency full-length cDNR cloning. Methods Enzymol. 303,
ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector MA, and transformed into adaptored by a complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into adaptored competent B. coli Xillo-Gold (Stratagene) cells and selected for ampicillin resistance."

Novel oligonucleotides useful for the prevention and treatment of allergies, cancer, and autoimmune disorders and for ameliorating symptoms resulting from exposure to a bio-warfare agent.

Claim 4; Page 30; 46pp; English.

The invention relates to novel immunogenic CpG oligodeoxymucleotides

```
CC (AAC80581-C80723). The oligonucleotide are at least 10 bases long and comprise one of the generic sequences 5-NAWR-250-AWNN-19. To 5-RY-CpG-RY - 19. The central CpG motif is unmethylated, and the oligonucleotide elivery complex opensising an oligonucleotide of the invention and a targetting to degent, and a pharmaceutical composition comprising the oligonucleotide delivery complex. The oligonucleotide of the invention and a targetting and a pharmaceutical composition comprising the oligonucleotide act of alivery complex. The oligonucleotides are able to induce a there a cell-mediated (T-cell) response or a humoral seponse. With coligonucleotides of the sequence 5-NAY-CpG-NAY-3 being able to induce a humoral response. It is thought that after a cell-mediated response and dendritic cells, which then release cyckines, cell-macrophages and dendritic cells, which then release cyckines, leading to activation of natural killer (NK) cells. A cell-mediated or humoral response can then ocut by activation of T- or B-cells. The humoral response can then ocut by activation of T- or B-cells. The chadiorating an allergic reaction (preferably asthma), or an infection, amelocating an allergic reaction (preferably asthma), or an infection, conditions which may be treated include eccema, allergic conditions which may be treated include viral, conditions, and the infections which may be treated include viral, conditions, and the infections which may be treated include viral, conditions, and the infections which may be treated include viral, because the infections which may be treated include viral, conditions, and the infections which may be treated include viral, because the infections which may be treated include viral, conditions, and the infections which may be treated include viral, conditions, and chainstened which may be treated include viral, conditions, and chains and multiple sold allergies and chains and conditions, and conditions which may be treated include viral, cused in the treatment of an autoimmune disorder (e

The present invention relates to an immunostimulatory composition, which comprises at least one oligonucleotide comprising both an RNA region and a DNA region. The composition is useful for enhancing an immune response or inducing cytokines. It can be used as a vaccine adjuvant and in treating diseases, including pathogenic infection, {non-}malignant tumours (e.g. cancers of the brain, lung, ovary, breast, prostate or colon, or carcinomas and sarcomas), autoimmune diseases or allargies (e.g. allergic rhinitis, hay fever or food allergies), Lyme disease, hepatitis, HIV or malaria. The composition is also useful for treating, preventing or ameliorating the symptoms resulting from exposure to a biowarfare agent, e.g. Ebola, Anthrax or Listeria. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of
/*tag= a
/note= "optionally thymidine is replaced by uracil to
form RNA or DNA/RNA hybrids. Thymidine is linked to at
least one other base through a ribose sugar"
                                                                                                                                                                                                                                                                                                                                    New immunostimulatory compositions comprising RNA/DNA hybrid oligonucleotides, useful for enhancing an immune response or inducing cytokines, particularly for treating diseases, e.g. cancer, allergy or HIV infection.

comprises at least one oligonate comprising both an RNA region and a DNA region. The composition is useful for character adjuvant and in treating cytokines. It can be used as a vaccine adjuvant and in treating diseases, including pathogenic infection, (non-)malignant tumours (e.g. cancers of the brain, lung, overy, breast, prostate or colon, or carcinomas and sarcomas), autoimmune diseases or altergies (e.g. altergic rhinitis, hay fever or food altergies), Lyme diseases, hepatitis, HIV or malaria. The composition is also useful for treating, preventing or ameliorating the symptoms resulting from exposure to a biowarfare agent, e.g. Ebola, Anthrax or Listeria. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of
                                                                                                                                                                                                                                                                          new immunostimulatory compositions comprising RNA/DNA hybrid oligomucleotides, useful for enhancing an immune response or inducing cytokines, particularly for treating diseases, e.g. cancer, allergy or HIV infection.
form RNA or DNA/RNA hybrids. Thymidine is linked to at
least one other base through a ribose sugar"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DNA/RNA hybrid; phosphorothioate backbone; immunostimulatory; vaccine; infection; allergy; cancer; hypersemaitivity; bio-warfare; immunostimulant; antiallergic; cytostatic; antimicrobial; anti-HIV; immunosuppressive; protozoacide; virucide; hepatotropic; gene therapy; antiinflammatory; antibacterial; ss.

```
The present invention relates to an immunostimulatory composition, which comprises at least one oligonucleotide comprising both an RNA region and a DNA region. The composition is useful for enhancing an immune response or inducing cytoxines. It can be used as a vaccine adjuvant and in treating diseases, including pathogenic infection, (non-)malignant treating diseases, including pathogenic infection, non-)malignant colon, or cancers of the brain, lung, ovary, breast, prostate or colon, or carcinoma and sarcomas), autoimmune diseases or allergies (e.g. allergic thinitis, hay fever or food allergies), Lyme disease, hepatitis, HIV or malaria. The composition is also useful for treating, preventing or ameliorating the symptoms resulting from exposure to a biowarfare agent, e.g. Ebola, Anthrax or Listeria. The present sequence is an immunosimulatory oligonucleotide described in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1..20

The present invention relates to an immunostimulatory composition, which comprises at least one oligonucleotide comprising both an RNA region and a DNA region. The composition is useful for enhancing an immune response or inducing cytckines. It can be used as a vaccine adjuvant and in treating diseases, including pathogenic infection, (non-)malignant trumours (e.g. cancers of the brain, lung, ovary, breast, prostate or colon, or carcinomas and sarcomas), autoimmune diseases or allergies (e.g. allergic rhinitis, hay fever or food allergies), Lyme disease, hepatitis, HIV or malaria. The composition is also useful for treating, preventing or ameliorating the symptoms resulting from exposure to a biowarfare agent, e.g. Ebola, Anthrax or Listeria. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNA/RNA hybrid; phosphorothioate backbone; immunostimulatory; vaccine; infection; allergy; cancer; hypersensitivity; bio-warfare; immunostimulant; antiallergic; cytostatic; antimicrobial; anti-HIV; immunosuppressive; protozoacide; virucide; hepatotropic; gene therapy; antiinflammatory; antibacterial; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                      The present invention relates to an immunostimulatory composition, which comprises at least one oligonucleotide comprising both an RNA region and a DNA region. The composition is useful for enhancing an immune response or inducing cytokines. It can be used as a vaccine adjuvant and in treating diseases, including pathogenic infection, {non-}malignant tumours (e.g. cancers of the brain, lung, ovary, breast, prostate or colon, or cancers and sarcomas), autoimmune diseases or allergies (e.g. allergic rhinitis, hay fever or food allergies), Lyme disease, preventing, HIV or malaria. The composition is also useful for treating, preventing or amaliorating the symptoms resulting from exposure to a biowarfare agent, e.g. Ebola, Anthrax or Listeria. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of
                                                                                                                                                         New immunostimulatory compositions comprising RNA/DNA hybrid oligomuclectides, useful for enhancing an immune response or inducing cytokines, particularly for treating diseases, e.g. cancer, allergy or HIV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                 The invention describes a vaccine comprising one or more epitopes of a Paramyxoviridae F protein, and one or more CpG (cytosine followed by guanine linked by phosphate bond)-oligoddeoxymucleotides (ODNS). The vaccine is useful for vaccinating a patient especially against viruses of the Paramyxoviridae family e.g. respiratory syncytial virus (RSV), the primary cause of viral bronchiolitis and pneumonia in infants and children, and infectious pulmonary disease in infants. RSV has been particularly implicated in death of infants that are premature, have ronchopulmonary dysplasia, or congenital heart conditions. This sequence represents an oligodideoxymucleotide that can be used in the creation of the vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CpG oligodeoxymucleotide; dendritic cell; tumour; immunotherapy; vaccine; cytostatic; immunostimulant; gene therapy; ss.
Vaccine for immunizing patient against respiratory syncytial virus, has epitopes of Paramyxoviridae P protein, and cytosine followed by guanine linked by phosphate bond-oligodideoxynucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The present sequence is that of a CpG oligodeoxynucleotide of the invention. A claimed method for generating dendritic cells involves contacting a dendritic cell precursor, especially a monocyte, with a D type oligodeoxynucleotide (see ACC48294) containing a central unmethylated CpG motif. The method is useful for generating mature dendritic cells and enhancing Tell responses, thus enhancing antigen presentation. Mature dendritic cells are useful for tumour immunotherapy, for augmenting an immune response to an infectious agent or to a vaccine, and as vaccines to prevent future infection or to activate the immune system to treat diseases such as cancer. Mature dendritic cells may also be used to produce activated I lymphocytes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CpG oligodeoxynucleotide; dendritic cell; tumour; immunotherapy; vaccine; cytostatic; immunostimulant; gene therapy; ss.
cell precursor, such as a monocyte, with such an oligodeoxymucleotide. The method is useful for generating mature dendritic cells and enhancing T cell responses, thus enhancing antiqen presentation. Mature dendritic cells are useful for tumour immunotherapy, for augmenting an immune
                                                                      response to an infectious agent or to a vaccine, and as vaccines to prevent future infection or to activate the immune system to treat diseases such as cancer. Mature dendritic cells may also be used to produce activated T lymphocytes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Generating mature dendritic cells for tumor immunotherapy or as vacor activating the immune system to treat diseases such as cancer, comprises contacting a dendritic cell precursor with a D type oligodeoxynucleotide.

                                                                                           cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Generating mature dendritic cells for tumor immunotherapy or as vaccines
                                                                      The present sequence is that of D type CpG oligodeoxynucleotide D29, which is used in a claimed method for generating a mature dendritic cell. The method involves contacting a dendritic cell precursor, especially a monocyte, with the oligonucleotide. The method is useful for generating mature dendritic cells and enhanning T cell responses, thus enhancing antigen presentation. Mature dendritic cells are useful for tumour immunotherapy, for augmenting an immune response to an infectious agent or to a vaccine, and as vaccines to prevent future infection or to activate the immune system to treat diseases such as cancer. Mature dendritic cells may also be used to produce activated T lymphocytes
                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               for activating the immune system to treat diseases such as cancer, comprises contacting a dendritic cell precursor with a D type oligodeoxynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 no base"

Cationic liposome composition for delivering oligodeoxymucleotides including a CpG motif in clinical applications, comprises a cationic lipid, a co-lipid, stabilizing agent and an encapsulated oligonucleotide.

Disclosure; Fig 10C; 110pp; English

The invention relates to sterically stabilised cationic liposomes (SSCL) which comprises a cationic lipid, a collipid, stabilising agent and encapsulating a K type oligodeoxymuclectide (ODN) including a CpG motif. The invention is useful in pharmaceutical composition for impairing control in the invention is useful in pharmaceutical composition for impairing a control in a subject; for stimulating an immune response, which is expression of a cytokine (e.g. interferon gamma), particularly immunotherapeutic response against tumours or stimulating an in vivo or immune cell, and for inducing an immune response against an infectious agent e.g. virus, bacteria and fungus. It is also useful for delivering oligodeoxymucleotides including a CpG motif in clinical applications; for treating infectious diseases (e.g. tularemia, malaria, applications; for treating infectious and leishmaniasis), cancer (e.g. solid tumours, AIDS-associated Kaposi's tumour, thyroid cancer (e.g. solid tumours, allergic asthma, urticaria, food allergies), autoimmune diseases (e.g. diabetes, theumatodia arthritis, lupus erythematosus and formulating selerosis) and postiasis. The present sequence is a D class CpG on the control of the con ODN potentially useful for encapsulating in SSCL 

Sequence 20 BP; 2 A; 4 C; 12 G; 2 T; 0 U; 0 Other;

Cationic liposome composition for delivering oligodeoxynucleotides including a CpG motif in clinical applications, comprises a cationic lipid, a co-lipid, stabilizing agent and an encapsulated oligonucleotide.

Example 8; Page 52; 110pp; English.

The invention relates to sterically stabilised cationic liposomes (SSCL) which comprises a cationic lipid, a co-lipid, stabilising agent and encapsulating a K type oligodeoxymucleotide (ODN) including a CpG motif. The invention is useful in pharmaceutical composition for impairing a CpG motif. The invention is useful in pharmaceutical composition for impairing an immune relation in a subject; for stimulating an immune response, which is expression of a cytokine (e.g. interferon gamma), particularly immunotherapeutic response against tumours or stimulating an in vivo or an invitro immune cell, and for inducing an immune response against an infectious agent e.g. virus, bacteria and fungus. It is also useful for delivering oligodeoxymucleotides including a CpG motif in clinical applications; for treating infectious diseases (e.g. tularemia, malaria, capplications; for treating infectious diseases (e.g. tularemia, malaria, capplications; allergic asthma, unticaria, food allergies), cancer cells. allergic asthma, unticaria, food allergies), autoimmune diseases (e.g. diabetes, rheumatoid arthritis, lupus erythematosus and multiple solerosis) and psoriasis. The present sequence is a D class odn potentially useful for encapsulating in SSCL

Inducing the production of vascular endothelial growth factor by a cell, useful for inducing angiogenesis, comprises contacting the cell with a CpG oligodeoxynucleotide.

Example 7; SEQ ID NO 13; 37pp; English.

The present invention describes a method for inducing the production of vascular endothelial growth factor (VEGF) by a cell comprising contacting the call with a CpG oligonuclectide and therefore inducing the production of VEGF by the cell. Also described: [1] inducing neovascularisation in a tissue, comprising introducing a CpG oligonuclectide into an area of the cilisue where the formation of new blood vessels is desired, and so inducing neovascularisation in the area of the tissue, [2] promoting angiogenesis in an area of the subject where angiogenesis is desired, comprising introducing a CpG oligonuclectide to the area, and so promoting angiogenesis in the subject; and [3] screening for an agent that inhibits neovascularisation, comprising administering a CpG oligonuclectide to a non-human mammal and administering a CpG oligonuclectide to a non-human mammal and administering a CpG oligonuclectides have vulnerary, vasctropic and antiarteriosclerotic coligonuclectides can be used in gene therapy. The method and the CpG oligonuclectides can be used in gene therapy. The method and the CpG oligonuclectides can be used in new pagiogenesis or cathorities, and can be used in new pagiogenesis or an extension, such as in subjects with a skin graft, subjects who exhibit male pattern baldness, or subjects who have a wound or who have atherosclerosis or ischaemia. The method may also be used in screening cor exhibit male pattern belong may also be used in screening cor processed in the exemplification of the processed in the exemplification of the processed in the covasculariation. New immunostimulatory compositions comprising RNA/DNA hybrid oligonuclectides, useful for enhancing an immune response or inducing cytokines, particularly for treating diseases, e.g. cancer, allergy or HIV infection.

Example 11; Page 61; 68pp; English.

The present invention relates to an immunostimulatory composition, which comprises at least one oligonucleotide comprising both an RNA region and a DNA region. The composition is useful for enhancing an immune response or inducing cytokines. It can be used as a vaccine adjuvant and in treating diseases, including pathogenic infection, (non-)malignant tumours (e.g. cancers of the brain, lung, ovary, breast, prostate or colon, or carcinomas and sarcomas), autoimmune diseases or allergies (e.g. allergic thinitis, hay fever or food allergies), Lyme disease, hepatitis, HIV or malaria. The composition is also useful for treating, preventing or ameliorating the symptoms resulting from exposure to a biowarfare agent, e.g. Ebola, Anthrax or Listeria. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Description

Sequence 3, Application US/09740027

Sequence 3, Application US/09740027

Patent No. 6485939

GENERAL INFORMATION:
PAPPLICANT: NA. Jane et al
TITLE OF INVENTION: ISOLATED HUMAN TRANSPORTER COFACTOR
TITLE OF INVENTION: OCA-CTOR PROTEINS, MUCLEIC ACID MOLECULES ENCODING HUMAN TRANSPORTER
TITLE OF INVENTION: OCA-CTOR PROTEINS, AND USES THEREOF
TILE REPERRANCE: CLOO1052

CURRENT APPLICATION NUMBER: US/09/740,027

CURRENT APPLICATION NUMBER: US/09/740,027

SOFTWARE: Patence of Windows Version 4.0

Sequence 4, Application US/08809523

Sequence 4, Application US/08809523

Patent No. 6207416

GENERAL INFORMATION:

APPLICANT: Sarev, Sergei. A., Emerson,

APPLICANT: Suzamne U., Purcell, Robert H.

TITLE OF INVENTION: Recombinant Proteins Of Hepatitis E And Their

TITLE OF INVENTION: Use In Diagnostic Methods And Vaccines

NUMBER OF SEQUENCES: 107

CORRESPONDENCES: 107

STREET: 345 PARK AVENUE

CITY: NEW YORK

STATE: NEW YORK

COUNTRY: USA
                                                                                                ZIP: 10154
COMPUTER READBLE FORM:
MEDIUM TYPE: FLOPPY DISK
COMPUTER: IBM PC COMPATIBLE
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: WORDPRERECT 5.1
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/440,316
FILING DATE: 11-APR-1997
CLASSIFICATION: 424
PRIOR APPLICATION DATA:
APPLICATION NUMBER: 124459
FILING DATE: CLASSIFICATION: 36,459
REPERENCE/DOCKET WUMBER: 2026-4255
REFERENCE/DOCKET WUMBER: 36,459
REFERENCE/DOCKET WUMBER: 2026-4255
TELECOMMUNICATION INFORMATION:
TELESTRAK: (212) 758-4800
TELESTRAK: (212) 751-6849
INPORMATION POR SEQ ID NO: 4:
SEQUENCE CHARACTERISTICS:
LENGTH: 7168 base paire
TWORP: nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     COUNTY: USA

APPLICANT: Emeraton, Suzanne U., Purcell, Robert H.,
APPLICANT: Emeraton, Suzanne U., Purcell, Robert H.,
APPLICANT: Tarrev, Sergei. A., and Robinson, Robin A.
TITLE OF INVENTION: Recombinant Proteins Of Hepatitis E And Their
TITLE OF INVENTION: A Pakistani Strain Of Hepatitis E And Their
TITLE OF INVENTION: Dee In Diagnostic Methods And Vaccines
NUMBER OF SEQUENCES: 111
CORRESPONDENCE ADDRESS:
ADDRESSEE: MORGAN & FINNEGAN
STREET: 345 PARK AVENUE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequences were basecalled with phred and vector was masked with crossmatch (see http://genome.washington.edu). Sequences were the trimmed from both ends to remove low quality bases and masked

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

\* sequencing reads that have not been assembled into \* contigs. Runs of N are used to separate the reads \* and the order in which they appear is completely arbitrary. Low pass sequence sampling is useful for \* identifying clones that may be gene-rich and allows \* overlap relationships among clones to be deduced. \* However, it should not be assumed that this clone \* will be sequenced to completion. In the event that the record is updated, the accession number will \* be preserved. NOTE: This record contains 81 individual

NOTE: This is a 'working draft' sequence. It currently consists of 6 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                TITLE

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       NOTE: This is a 'working draft' sequence. It currently consists of 9 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

It currently consists of 3 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.

Specifically, the indicated order and orientation of each sequence contign has been established using one or more of the following: read-pair data from individual subclones, overlaps with neighboring clones, alignment with available reference sequence (e.g., human), and/or confirmation by PCR testing. In addition, the sequence assembly is based on at least 8X average coverage in Q2D bases and has been reviewed to rule out gross misassemblies, the low-quality ends of sequence contigs have been trimmed away, and each base is associated with a Phrap-derived quality score.

Sequencing vector: plasmid; n/a; 100% of reads (Chemistry: Dye-terminator Big Dye; 100% of reads Assembly program: Phrap, version 0.990319 Consensus quality: 181869 bases at least Q40
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Direct Submission

* NOTE: This is a 'working draft' sequence. It currently consists of 10 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.

* This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.
